## Press Release

Final Phase Complete for Thunderbird Marina, West Vancouver B.C. Canada.....April 2014

International Marine Floatation Systems, Inc (IMFS) has just completed final phase 5 of the Thunderbird Marina in West Vancouver British Columbia, in Fishermans Cove, which was started with phase 1 in 2008. This marina incorporated both concrete main docks with concrete fingers, along with our IMFS Hybrid system.

IMFS worked closely with Thunderbird management team and West Shore Constructors Ltd. since 2008 to completely replace the old float system and reconfigure the marina to suit the existing client base for larger and more usable slip sizes. IMFS introduced the Hybrid float system which used structural concrete main floats together with the IMFS Torque Tube finger. These fingers are made up of galvanized steel tube

frame with composite "Trex" decking and encased foam billets for floatation. This allowed Thunderbird Marina management to reduce many of the slip fingers to 2'-0" wide, maximizing their water-lot capacity.

The 608 boat slip marina with mixed use size slip and covered moorage, rivals any world class marina. The covered slips are designed & engineered to highest standards, using 8" aluminum arched truss & columns together with corrugated pre-finished aluminum roofing.
